Frailea sp.: a) planta + flor; b) flor desnaturalizada + corte longitudinal de la misma; d) di. variolos + e) si. semilla + f) si. estalle de la misma + g)

Fraileeae B. P. R. Chéron, Tribus nova

by Brice P. R. CHÉRON

mail: brice.cheron@laposte.net

Summary : the aim of this article is to establish the new tribe of the *Fraileeae*.

Keywords : *Frailea*, *Fraileeae*, tribe, systematic.

Résumé : le but de cet article est de fonder la nouvelle tribu des *Fraileeae*.

Mots-clés : *Frailea*, *Fraileeae*, tribu, systématique.

I°) Typification

Fraileeae B. P. R. Chéron, Tribus nova

Typus: *Frailea* N. L. Britton & J. N. Rose (1922) in BRITTON Nathaniel L. & ROSE Joseph N. (1922): The Cactaceae. Volume III, p. 208-211.

Typus speciei identicus quam ejus generis *Frailea* : *Frailea cataphracta* (E. Dams) N. L. Britton & J. N. Rose (1922). Basionymum : *Echinocactus cataphractus* E. Dams (1904) in DAMS Erich (1904): Echinocactus cataphractus n. sp. Monatsschrift für Kakteenkunde, Vierzehnter Band [vol. 14] : p. 172-173.

II°) Diagnosis

Fraileeae B. P. R. Chéron, tribus mono-generica cujus genus typicum *Frailea* N. L. Britton & J. N. Rose (1922) est. Insigniter qualitatem monophyleticam distinguenda.

III°) Description

Fraileeae B. P. R. Chéron is a **monogeneric and monophyletic tribe**. Its essential, diagnostic characteristics are therefore the same as those established for the genus *Frailea* (BRITTON & ROSE 1922) with the addition of differences that were brought out by studying and improving knowledge on *Frailea* species for now almost a century :

- green, succulent, leafless and perennial plants,
- **always dwarf, minute** plants(exceptionally : bigger and larger by trophic and hydric excesses up to five centimetres in diameter),
- **mostly solitary** or caespitose plants, with a semi-cryptic habit,

- plants forming globular bodies (stems) or less usually narrowly cylindrical (or becoming as such slowly by ageing), with **umbilicate, depressed apex** or less often simply flat,
- costae and tubercles with geometrical and regular arrangements, the **intercostal rows** of which are **poorly marked**, not exceeding 15 % of the radius of the stem, spination excluded,
- **tuberous or napiform roots, always massive** (root system weight \geq stem weight) and **retractile**,
- **spines small or even very small**, scabrid, linear or slightly curved, (1)3-5(10) mm long, bundled by 4 to 18 per areole, most of the time flattened, sometimes with 1-4 erect central spines, finally only weakly harmful,
- actinomorphic flowers **always of a clear yellow**, pale in most of the occurrences (except in cases of hyperchromy, albinism and in cultivars), broad and conspicuous when compared to the bodies of the plants which produce them, **chasmogamous (heterogamy) or cleistogamous (autogamy)**,
- receptacle (upper part of the gynoecium) of yellow colour, yellow-green or more rarely tinged red during anthesis,
- inflorescence **almost always uniflorous** or multiflorous but then in succession during anthesis, **arising apically** (which can become quickly lopsided to allow space for the next flower),
- ovaries then fruits with an **always densely woolly and aciculated hypanthium** (the ratio tomentum / aciculesis is however variable),
- seeds **galeiform** (helmet-shaped), **large** when compared to the size of fruits, from 1 to 1,6 mm long, with smooth or spinulescent testa (especially on edges), glossy, with a cellular scalariform structure,
- hilum very broad and marked, concave, surrounded by a margin histologically derived from the testa,
- **dissemination by myrmecochory** or eventually by hydrochory.

The chorology of the tribe merges with the one of the genus it contains : in **South America only**, where it is known with certainty in Argentina (N & N-E), Bolivia (S-E), Brazil (S-W), Paraguay and Uruguay, from 20 m to 900 m in altitude.

Being based on *Frailea* (BRITTON & ROSE 1922), the etymology of *Fraileeae* B. P. R. Chéron is the same. The suffix -eae is exclusive to the taxonomic rank of the tribe, accordingly to article 19.3 of the International Code of Nomenclature (Melbourne Code) (MAC NEILL & al. 2012).

IV°) Systematics

Since Franz Buxbaum's major publication in 1958 (BUXBAUM 1958), almost every botanist and systematician having worked on *Cactaceae* A. L. de Jussieu (1789) *nomen conservandum* (WIERSEMA & al. 2015), integrated the genus *Frailea* into the tribe *Notocacteae* F. Buxbaum (1958) (ENDLER & BUXBAUM 1979, GIBSON & NOBEL 1986, BARTHLOTT & HUNT 1993, ANDERSON 2001, TAKHTAJAN 2009, ANDERSON & EGGLI 2011). Today we know, thanks to phylogenetic studies, especially those of Reto Nyffeler, that this is false (NYFFELER 2002, CROZIER 2005, NYFFELER & EGGLI 2010, HERNÁNDEZ-HERNÁNDEZ & al. 2011, LODÉ 2015) because *Frailea* proceeds from a clearly independent evolutionary lineage, even if there are evolutionary morphological similarities with other genera which are confusing.

Consequently, the following partial synonymy appears :

Fraileeae B. P. R. Chéron,

synonym: *Notocacteae* F. Buxbaum (1958)–*pro parte et typo excluso*.

This means that I still recognise the validity of the tribe *Notocacteae*, but this latter cannot and must not include the genus *Frailea* which now belongs to *Fraileeae* B. P. R. Chéron.

To date, the tribe *Fraileeae* B. P. R. Chéron is understood as included in the subfamily *Cactoideae**, which is of course itself nested in the family *Cactaceae*. This tribe includes a single genus (monogeneric tribe): *Frailea* N. L. Britton & J. N. Rose (1922).

Especially and to keep it monophyletic, this tribe excludes *de facto* the genera *Astrophytum* C. Lemaire (1839), *Blossfeldia* E. Werdermann (1937), *Copiapoa* N. L. Britton & J. N. Rose (1922), *Notocactus* (K. M. Schumann) A. V. Frič (1928) and *Parodia* C. L. Spegazzini (1923) to which genus *Frailea* was subservient, partly merged, or even put into various synonymy levels in the past (BARTHLOTT 1988, EGGLI & NYFFELER 1998, BRUMMITT 2000, HALDA & MALINA 2005).

Thus, we get the following systematic classification:

CACTACEAE

 └ *Cactoideae*

 └ *Fraileeae*

 └ *Frailea*.

* *Cactoideae* is an *autonymum* (autonyme). It works as explained in article 6.8 of the Melbourne Code.

V°) Acknowledgements

My thanks go to my small collection of *Frailea* which suffered from several sorts of torture for carrying out this article and to serve science.

With equal sincerity, I greatly thank Joël Lodé for his several bibliographic investigations and suggestions, for reading the manuscript, as well as having accepted to publish an absolutely unknown person.

I am deeply grateful to professor John J. Lavranos for having had the patience to correct my Latin and to Steven A. Hammer for having corrected my English version.

My frank acknowledgements are finally addressed to professor Len E. Newton for the checking of typifying processes and conformity to the International Code of Nomenclature (Melbourne Code).
